Lesson 4 Exercises

Hello ESP32

Use these exercises after your first upload works and the Serial Monitor shows output.

Exercise 1 Identify the Parts

Code	What It Does
void setup()	
void loop()	
Serial.begin(115200);	
Serial.println("Hello, ESP32!");	
delay(1000);	

Exercise 2 Change the Message

- Change the setup message to include your team number.
- Change the loop message to say the board is alive.
- Upload again.
- Confirm the Serial Monitor shows your new messages.

Exercise 3 Fix the Bugs

Buggy Code	Corrected Code
Serial.println("Hello ESP32!)	
Serial.begin(115200)	
serial.println("loop");	
delay(1000)	

Exercise 4 Skill Check

Create a safe ESP32 sketch that proves you can upload code and read board output.

- Print at least two setup messages.

- Print one loop message once per second.
- Use Serial.begin(115200).
- Open Serial Monitor at 115200 baud.
- Explain which lines run once and which lines repeat.
